

Dear Hiring Manager,

I am writing to apply for the IT On-Site Support Technician position with WSP. I offer experience in enterprise IT support, workstation and application troubleshooting, ServiceNow, SCCM, VPN access, Microsoft technologies, network support, and technical documentation. My combined background in IT, software development, network administration, and geomatics engineering would allow me to support WSP's employees with both technical capability and an understanding of the engineering environment in which they work.

In my current position as a Full Stack Developer and IT Support Specialist at Total Logistics Control, I support users, business applications, reporting systems, and processes connected to the TruckMate ERP platform. I develop and maintain .NET applications, SQL queries, Crystal Reports, and automated processes while also resolving user, workstation, access, software, and connectivity issues. This experience has reinforced an important principle in my work: effective technology support begins with understanding the user's business processes. I take the time to understand how employees perform their work before recommending or implementing a technical solution.

Previously, as a Service Desk Technician supporting Bombardier, I handled software, account, workstation, authentication, and VPN incidents in an enterprise environment. I used ServiceNow and SCCM to log, investigate, resolve, document, and escalate requests. I also supported Pulse Secure VPN access, SafeNet authentication, and password-related issues. During my IT technician internships, I prepared Windows PCs and Mac computers, installed operating systems and business applications, supported users, and documented technical procedures.

My support experience also includes hands-on hardware and software work, including preparing and configuring Windows PCs and Mac computers, installing operating systems and business applications, diagnosing workstation and peripheral issues, supporting network connectivity, and assisting users with access and performance problems. I am comfortable investigating unfamiliar issues, consulting technical documentation, collaborating with specialized teams, and learning new systems quickly.

My education in topographic engineering provides an additional connection to WSP's engineering and infrastructure work. I have practical experience with land surveying, survey measurements, coordinates, technical drawings, and AutoCAD Civil 3D. Although I am applying for an IT position, this background helps me understand the workflows and specialized applications used by engineers, surveyors, designers, and other technical professionals. I believe this combination would help me communicate effectively with WSP users, understand the operational impact of their technical issues, and provide more informed support.

I hold ACS qualifications in Network Administration and Full-Stack Development, as well as training through the Google IT Support Professional Certificate, Cisco CCNA v7, and AWS Academy Cloud Foundations. I bring a structured troubleshooting approach, strong customer-service skills, and the ability to collaborate with users, managers, developers, and infrastructure teams. I am also comfortable working on-site, visiting regional offices, supporting critical

meetings, and adjusting my schedule when priority incidents or events require additional coverage.

I am a Canadian citizen and am authorized to work anywhere in Canada without sponsorship. I am currently based in Montreal, Quebec, and I am open to relocating to another province or WSP office location for the right long-term opportunity. I am also available to travel between regional offices and adjust my schedule when critical meetings, VIP support, deployments, or priority incidents require additional coverage.

Thank you for considering my application. I look forward to the opportunity to discuss how my experience could support WSP's employees and operations.

Sincerely,

James Fallouh
